Exp 9

To create a custom server and explore core Node.js modules, you can use the built-in http, os, path, and events modules. These are part of the Node.js standard library and do not require external installation.

Programs

1. custom server :

server.js

```
import  http from 'http';
const PORT=3000;
const server = http.createServer((req, res) => {
        res.writeHead(200, { 'Content-Type':
'text/plain' });
    res.end('Hello, this is your custom Node.js
server!\n');
 });
server.listen(PORT, () => {
    console.log(`Server running at
http://localhost:${PORT}/`);
```

```
});
```

Output:

2. path

path.js

```
import path from 'path';
import { fileURLToPath } from 'url';
const __filename = fileURLToPath(import.meta.url);
const __dirname = path.dirname(__filename);
console.log("File Name: " + path.basename(__filename));
console.log("Full Path: " + __filename);
console.log("Location: " + __dirname);
```

output:

3. os

os.js

```
import os from 'os';
let currentOS = {
  name: os.type(),
  architecture: os.arch(),
  platform: os.platform(),
  release: os.release(),
  version: os.version(),
  freeMem: (os.freemem()/1024 **
3).toFixed(2)+`GB`,
};
console.log(`details of current OS are:`);
console.log(currentOS);
```

output:

4. event emitter:

event1.js

```
import EventEmitter from 'events';
```

```
const myEmitter = new EventEmitter();
myEmitter.on('greet', (name) => {
  console.log(`Hello ${name}`);
});
myEmitter.emit('greet', 'Arvin');
```

output:
